

ELISA 【Sample Type : Human】

Product Code	Product Name	Measurement Range	Application				
			Serum	EDTA-Plasma	EDTA-Plasma (Postheparin)	Heparin - Plasma	Super-natant
27180	Human Serum HTGL Assay Kit - IBL	0.08 ~ 5 ng/mL	○	○	○	-	-
27179	Human GPIHBP1 Assay Kit - IBL	7.8 ~ 500 pg/mL	○	○	-	-	-
27182	Human EL Full-Length Assay Kit - IBL	31.25 ~ 2000 pg/mL	○	○	○	-	○
27263	Human EL C-Terminal Assay Kit - IBL	0.13 ~ 8 ng/mL	○	○	○	-	-
27191	Human ApoA5 Assay Kit - IBL	0.31 ~ 20ng/mL	○	○	-	-	-
27181	Human ApoB-100 Assay Kit - IBL	0.13 ~ 8.4 μg/mL	○	○	-	-	○
27745	Human ANGPTL2 Assay Kit - IBL	0.05 ~ 3.5 ng/mL	○	○	-	-	○
27750	Human ANGPTL3 (h.s) Assay Kit - IBL	0.47 ~ 30 ng/mL	○	○	-	-	○
27749	Human ANGPTL4 Assay Kit - IBL	23.44 ~ 1500 pg/mL	○	○	-	-	-
27795	Human ANGPTL8 Assay kit - IBL	0.61 ~ 80 pmol/L	○	○	-	-	○

Others 【Sample Type : Human】

Product Code	Product Name	Measurement Range	Application				
			Serum	EDTA-Plasma	EDTA-Plasma (Postheparin)	Heparin - Plasma	Super-natant
27185	LPL /HTGL Activity Assay Kit - IBL	HTGL :135 ~ 431 U/L	-	-	○	-	-
27264	LPL /HTGL Activity Control Plus Kit - IBL	LPL : 30 ~ 153 U/L	-	-	○	-	-

Postheparin : Blood samples are collected after administration of the intravenous injection of heparin.

Lipid Metabolism Assay Kit

Research for Dyslipidemia and Arteriosclerosis - Research Use Only -

HTGL (hepatic triacylglycerol lipase) has an important role in lipoprotein metabolism as a lipolytic enzyme that hydrolyzes triglycerides (TG) and phospholipids in chylomicron remnants, intermediate-density lipoproteins (IDL) and high-density lipoproteins (HDL). It has been reported that hypercholesterolemia or triglyceridemia is observed and β -very-low-density lipoproteins (VLDL), chylomicron remnants, IDL, TG-rich low-density lipoproteins (LDL) and HDL are accumulated in patients with deficiency of HTGL.

EL (endothelial lipase) is a metabolic enzyme of HDL. It is phospholipase A1 molecule that is high substrate specificity against to phospholipid that exists in high density lipoprotein, HDL molecule and it promotes HDL metabolism through metabolizing HDL phospholipid. It has been considered that EL involves with lipid metabolism and elevating risk of arteriosclerosis as strong expression of EL on newly formed vessel, macrophage in arteriosclerotic lesions is observed while EL expresses in vascular endothelial cells and vascular smooth myocytes of normal blood vessels.

LPL (lipoprotein lipase) is an enzyme involved in the metabolism of triglyceride-rich lipoproteins including chylomicron (CM) and very low-density lipoprotein (VLDL). Secreted LPL mainly binds to heparan sulfate at the luminal surface of the capillary endothelium and hydrolyzes the triglyceride (TG) in triglyceride-rich lipoprotein into fatty acids and monoglycerides. Therefore, deficiency and reduction in activity of LPL are considered one of the important causes of hypertriglyceridemia.

GPIHBP1 (Glycosylphosphatidylinositol anchored high density lipoprotein binding protein 1) is an anchor protein that is modified by glycolipid and it has been known that it exists on a capillary endothelial cell membrane and involves with metabolism of triglyceride rich (TG-rich) lipoprotein (triglyceride). GPIHBP1 transports lipoprotein lipase (LPL) that is synthesized and secreted by adipocyte or skeletal muscle cells into capillary lumen and moors on the surface of endothelial cells. It has been revealed that GPIHBP1 has a significantly important role in TG-rich lipoprotein metabolism as it has been considered that gene mutation of GPIHBP1 is a cause of type 1 hyperlipidemia (high chylomicronemia).
